

eVoice

Audial Drive Alerts Solution

eVoice can sound pre-recorded audial alerts triggered by different pre-defined situations, based on ERM wide variety of solutions in order to alert the driver.

Triggers can be set for example for driving behavior or other safety violation, vehicle diagnostic events, location events such as: entering into perimeter, approaching road hazard, etc.

eVoice allows a fleet manager, or the operator of the service, to record in advance up to 100 audial warnings or use text-to-speech in the driver's native language, according to the desired alert set.

A user-friendly software application is provided so that the manager can easily manage all the alerts and create rules to match alerts with events. For example: if a driver makes a sharp turn, or goes over the speed limit a warning sound will be made to explain the incorrect behavior. ●
